Notes	<ul> <li>Use a magnet to identify steel. If it sticks, it's steel!         <ul> <li>Note that this doesn't tell you what type of steel you have, but it does help make sure you're not mistaking a non-magnetic metal for steel.</li> <li>Galvanized steel and Stainless steel can be shiny, sometimes blueish, and will not rust. They can not be welded in the school shop.</li> <li>Cast iron will show signs of being a molded product, it will have seam lines and be kind of porous and textured. It can not be welded in the school shop.</li> </ul> </li> <li>How to Identify Mild Steel         <ul> <li>https://www.wikihow.com/Identify-Mild-Steel</li> </ul> </li> </ul>
